

PROJECT PULSAR

Finite-model checks, numerical stability and complete costs

Computational evidence; physical convergence and biological accuracy remain open.

A: max error over G_0 , K and C ; harmonic tensor factorization only. $A = 7, 8$ overlap.

B: native/shared use rank 48; fixed V spans every checkpoint and eigensolver driver.

C: both methods share H , F , π and G_0 . Only propagation is independently checked.
